

SALUS

Power failures can happen for a variety of reasons, such as weather disasters or defects in power lines. To avoid panic in the dark, light helps. Therefore the idea was to create a wall lamp that can also be used as a flash light. The lamp is characterized by its angle, which makes it possible to illuminate its surroundings. Laid on its back or placed sideways, you can adapt the light source to your personal use. The lamp recharges itself on the wall module and has an autonomy of 17 hours when disconnected from the power supply. It also has two light levels; by pressing the button, you can choose between atmospheric light, strong torch light or the switch-off function.
